

MUHAMMED SAFVAN

Full Stack Developer | React.js · Next.js · Node.js · TypeScript · MongoDB

+91 8590872362 | safvann000@gmail.com | Kerala, India | LinkedIn | GitHub

PROFESSIONAL SUMMARY

Full Stack Developer with production internship experience designing and shipping end-to-end web applications across the MERN stack and Next.js ecosystem. Skilled in architecting RESTful APIs, modeling scalable MongoDB schemas, and building secure multi-role authentication systems. Brings a product-minded approach to engineering — balancing clean code architecture with real user impact, and consistently delivering features that are performant, maintainable, and built to scale. Experienced working within Agile teams, contributing across the full development lifecycle from schema design and API contracts to responsive UI delivery and production deployment.

TECHNICAL SKILLS

Frontend	React.js, Next.js, TypeScript, JavaScript (ES6+), Redux, Tailwind CSS, HTML5/CSS3, SSR, Responsive Design
Backend	Node.js, Express.js, RESTful API Design, MVC Architecture, JWT, Google OAuth 2.0, RBAC, Passport.js
Databases	MongoDB, Mongoose, Schema Design, Compound Indexing, Query Optimization, Relational References
Cloud & Tools	Git, GitHub, Docker, AWS, Vercel, Postman, Stripe API, npm
Engineering	Agile/Scrum, Code Review, Performance Optimization, Web Accessibility, CI/CD, Component Architecture

WORK EXPERIENCE

Full Stack Developer Intern | Bridgeon Solutions Aug 2025 – Present | Kerala, India

- Architected and shipped multiple production web applications across the MERN stack and Next.js, structuring each project with MVC separation of concerns, modular component design, and shared utility libraries — reducing cross-project code duplication by an estimated 30% and accelerating feature delivery across the team.
- Designed and maintained 40+ RESTful API endpoints across multiple projects, establishing consistent route/controller/service layering, centralized error handling, and input validation pipelines that standardized API contracts and significantly reduced integration-related bugs during peer code review.
- Modeled MongoDB schemas with Mongoose, applying compound indexing, field-level validation, and document reference strategies to enforce data integrity and support efficient query patterns in production — proactively collaborating with teammates on schema decisions to prevent costly migrations later.
- Engineered a multi-role authentication system combining JWT session management, Google OAuth 2.0, and RBAC middleware, building reusable auth guards that scaled across five user types without requiring per-route logic duplication.
- Built responsive, mobile-first UI component libraries using React.js and Tailwind CSS, establishing shared design patterns that reduced per-project component development time and ensured consistent visual behavior across desktop and mobile viewports.
- Improved frontend delivery performance by implementing server-side rendering, route-level code splitting, and lazy loading of non-critical components — measurably reducing initial bundle sizes and improving perceived load times across all deployed applications.
- Applied TypeScript across both client and server codebases, defining shared interface contracts between API response shapes and UI component props that caught integration errors at compile time and streamlined collaborative code review cycles.
- Participated actively in Agile sprint cycles — contributing to sprint planning, daily standups, and retrospectives — helping maintain consistent delivery velocity while adapting to evolving feature requirements across multiple concurrent projects.

PROJECTS

MediFind — Medicine Discovery Platform

Live | [GitHub](#) |
2026

- Designed the overall platform architecture as a role-segmented healthcare marketplace with five independent user modules: User, Doctor, Pharmacy, Delivery Partner, and Admin — each served through dedicated dashboards with module-specific workflows, route guards, and API access scopes, all within a unified Next.js and Express.js codebase.
- Built a prescription fulfillment engine that addresses a core healthcare access problem: rather than requiring users to find a single pharmacy stocking their entire prescription, the system aggregates real-time inventory across multiple nearby pharmacies, identifies the optimal supplier combination by proximity and stock completeness, and consolidates multi-vendor orders into one unified checkout — reducing steps from prescription to purchase by an estimated 60%.
- Designed and implemented 28+ typed RESTful API endpoints across six functional domains — medicine discovery, prescription management, pharmacy operations, delivery tracking, subscription billing, and administrative control — each with centralized request validation, structured error responses, and consistent JSON contracts enforced through TypeScript interfaces.
- Implemented a multi-layer authentication and authorization system: JWT for stateless session management, Google OAuth 2.0 for social sign-in, and granular RBAC middleware enforcing distinct access boundaries across all five user roles — ensuring no cross-role data leakage at either the API or frontend route level.
- Engineered a subscription monetization layer supporting monthly and yearly billing cycles for Doctor and Pharmacy accounts, with plan-level feature gating, lifecycle state management (active, expired, pending renewal), and premium route protection — designed to accommodate future payment gateway integration without structural changes.
- Built the medicine discovery experience with full-text search, alternative medicine recommendations, and proximity-based pharmacy discovery — reducing friction for users whose prescribed medicines were unavailable locally and surfacing viable alternatives alongside real-time coverage information.
- Delivered a comprehensive admin portal enabling platform operators to manage users, pharmacy registrations, prescription records, delivery assignments, subscription statuses, and platform-wide analytics — with every privileged action secured by server-side authorization middleware and frontend route guards.
- Optimized platform performance through compound MongoDB indexing on high-frequency query fields, API response caching for pharmacy inventory lookups, schema-level Mongoose validation to prevent malformed writes, and frontend code splitting with lazy loading — sustaining low-latency responses under concurrent pharmacy matching and fulfillment workloads.

Vyntra — Full Stack E-Commerce Platform

Live | [GitHub](#) |
2025

- Architected the full e-commerce system across a decoupled React frontend and Express/Node backend, designing the data model to support a complete product lifecycle — catalog management, inventory tracking, cart persistence, checkout flow, and post-purchase order management — with clean API boundaries between each layer.
- Built a faceted product discovery system with multi-field search, dynamic category filtering, price range controls, and sort options, enabling users to efficiently navigate large catalogs; query performance was optimized through compound MongoDB indexes on commonly filtered fields, achieving sub-second search response times.
- Developed an end-to-end Stripe payment workflow, integrating server-side payment intent generation, secure client-side payment processing, real-time payment status updates, and error handling for reliable checkout functionality.
- Implemented cart state management using Redux, structuring the store with clearly separated slices for cart items, user session, and order status — ensuring consistent UI state across page navigation, browser refresh, and multi-step checkout without data loss.
- Designed a role-based access control system separating customer and administrator surfaces, enforced through reusable JWT-verification middleware on the API layer and protected route wrappers on the frontend — preventing unauthorized access to all administrative operations.
- Built an admin dashboard to manage products, orders, users, and order status updates from a single secure interface.
- Deployed the application on Vercel with environment-based configuration, optimized page loading, and separate setups for development and production environments.

EDUCATION

Higher Secondary Education — Humanities

Victory College, Palakkad, Kerala

2025
